The **Model Context Protocol** enables communication with locally running MCP servers that provide additional tools and resources to extend Cline's capabilities. You can use **community-made servers** or ask Cline to create new tools specific to your workflow (e.g., "add a tool that gets the latest npm docs"). [See a demo here.](#)

Configure MCP Servers

CLINE

\$0.0000

Add the prospectReport field to the object page for ValueContracts entities. It should use the sap.ui.core.HTML component so that it can properly display HTML. This field should be placed on the page below the row containing the other fields- it should be large enough to display an HTML report that is readable. Use the MCPs

0 200.0k

Let me start by using the CDS MCP to search for the valueContracts entity.

Cline wants to use a tool on the cds-mcp MCP server:

search_model

Returns CDS model definitions (CSN), including elements, annotations, parameters, file locations and HTTP endpoints. Useful for building queries, OData URLs, or modifying models.

ARGUMENTS

```
{  "projectPath": "/Users/D023494/projects/git/ValueContra  "name": "ValueContracts",  "kind": "entity"}
```
